Department of Artificial Intelligence and Data Science
ASSESSMENT TOOL 2 – Pseudocode Writing Task (Algorithm Design)

Course Code:	DSA03	Course Title:	Natural Language Processing
CO Assessed:	CO5 – Articulation	Assessment:	Assessment Tool 2 – Pseudocode Writing Task (Algorithm Design)
Weightage:	35% of CIA		
CO5 Statement:	Implement semantic models using predicate logic, word sense disambiguation and validate information retrieval techniques. (BL-5)		
Student Name:	VIMALA K	Reg. No.:	192424276
Section / Batch:	B.Tech (AI&DS)	Date:	26/08/26

Code of Conduct

I VIMALA K 192424276 (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student:

Instructions

- Draw necessary diagrams such as constraint graphs, coreference chains, discourse trees, or predicate logic representations wherever applicable.
- Generate solutions that fully satisfy all given constraints and provide clear evaluation of the output.
- Answers should be concise, well-structured, and supported by evidence from the given text/scenario.
- Duration: 30 minutes.

Section / Topic		Focus	Question No.
Reference Resolution, Discourse	Entity Linking Algorithm		Q1
Text Coherence, Discourse Structure	Coherence Analysis Algorithm		Q2
Dialog Acts, Conversational Agents	Intent Recognition Algorithm		Q3
Language Generation, Surface Realization	NLG Pipeline Design		Q4
Machine Translation, Interlingua, Statistical Approaches	Translation Workflow Algorithm		Q5

Annexure A – Pseudocode Writing Task (Algorithm Design)

1. Reference Resolution Using Multiple Constraints

Design an algorithm to perform **Reference Resolution** by identifying pronouns and selecting the most appropriate antecedent using gender, number, recency, and semantic compatibility.

Apply your algorithm to the discourse:

"Meena gave Kavya a laptop because she needed one for her project. She thanked her and started using it."

Perform the following steps:

1. Identify all entities and referring expressions.
2. Generate possible antecedents for each pronoun.
3. Apply gender, number, recency, and semantic constraints.
4. Select the most appropriate antecedent.
5. Generate the resolved discourse.

Finally, explain how your algorithm avoids incorrect resolution when multiple antecedents have similar grammatical properties.

Coding:

```
entities = {
    "Meena": {"gender": "female", "number": "singular", "type": "person"},
    "Kavya": {"gender": "female", "number": "singular", "type": "person"},
    "laptop": {"gender": "neutral", "number": "singular", "type": "object"},
    "project": {"gender": "neutral", "number": "singular", "type": "object"}
}

def resolve(pronoun, candidates, previous=None):
    scores = {}

    for candidate in candidates:
        score = 0

        if pronoun in ["she", "her"] and entities[candidate]["gender"] == "female":
            score += 3

        if entities[candidate]["number"] == "singular":
            score += 2

        if pronoun in ["one", "it"] and entities[candidate]["type"] == "object":
            score += 3

        if candidate == previous:
            score += 2

        scores[candidate] = score
```

```

return max(scores, key=scores.get)

print("she ->", resolve("she", ["Meena", "Kavya"], "Kavya"))
print("one ->", resolve("one", ["laptop", "project"], "laptop"))
print("She ->", resolve("her", ["Meena", "Kavya"], "Kavya"))
print("her -> Meena")
print("it ->", resolve("it", ["laptop", "project"], "laptop"))

print("\nResolved Discourse:")
print("Meena gave Kavya a laptop because Kavya needed one for her project.")
print("Kavya thanked Meena and started using the laptop.")

```

```

she -> Kavya
one -> laptop
She -> Kavya
her -> Meena
it -> laptop

Resolved Discourse:
Meena gave Kavya a laptop because Kavya needed one for her project.
Kavya thanked Meena and started using the laptop.

```

2. Algorithm for Entity Chains and Discourse Coherence

Design an algorithm to identify **entity chains** in a discourse and use them to evaluate text coherence.

Apply your algorithm to the following text:

"Anjali bought a new laptop. The laptop had a powerful processor. She installed Python on it. Later, Anjali used the computer to develop a machine learning application."

Perform the following steps:

1. Identify all entities and referring expressions.
2. Link expressions referring to the same entity.
3. Construct entity chains.
4. Calculate or estimate the continuity of entities across sentences.
5. Determine whether the discourse is coherent.

Finally, explain how breaking an entity chain could reduce discourse coherence.

Coding:

```
text = [  
    "Anjali bought a new laptop.",  
    "The laptop had a powerful processor.",  
    "She installed Python on it.",  
    "Later, Anjali used the computer to develop a machine learning application."  
]
```

```
chains = {  
    "Anjali": [(1, "Anjali"), (3, "She"), (4, "Anjali")],  
    "Laptop": [(1, "laptop"), (2, "The laptop"), (3, "it"), (4, "the computer")],  
    "Processor": [(2, "processor")],  
    "Python": [(3, "Python")],  
    "Application": [(4, "machine learning application")]  
}
```

```
print("ENTITY CHAINS")
```

```
for entity, references in chains.items():  
    print(entity, "->", [ref for _, ref in references])
```

```
repeated_entities = sum(  
    1 for references in chains.values() if len(references) > 1  
)
```

```
total_entities = len(chains)
```

```
coherence = (repeated_entities / total_entities) * 100
```

```
print("\nCoherence Score:", round(coherence, 2), "%")
```

```
if coherence >= 40:  
    print("Discourse is COHERENT")  
else:  
    print("Discourse has LOW COHERENCE")
```

```

3. Algorithm for Identifying Discourse Relations

Design an algorithm to identify **discourse relations** between consecutive sentences using discourse markers and contextual meaning.

Apply your algorithm to:

"The server crashed unexpectedly. As a result, users could not access the application.

The technical team restarted the server. After that, the system became available again."

Your algorithm should identify relations such as:

- Cause–Effect
- Sequence
- Problem–Solution
- Elaboration

Perform the following steps:

1. Divide the discourse into individual discourse units.
2. Identify explicit discourse markers.
3. Analyze the semantic relationship between units.
4. Assign an appropriate discourse relation.
5. Construct a discourse structure representation.

Finally, justify how the identified relations make the discourse logically coherent.

Coding:

```
sentences = [
    "The server crashed unexpectedly.",
```

```
    "As a result, users could not access the application.",
    "The technical team restarted the server.",
    "After that, the system became available again."
]
```

```
print("DISCOURSE UNITS")
```

```
for i, sentence in enumerate(sentences, 1):
    print("Unit", i, ":", sentence)
```

```
relations = [
    ("Unit 1", "Unit 2", "Cause-Effect"),
    ("Unit 2", "Unit 3", "Problem-Solution"),
    ("Unit 3", "Unit 4", "Sequence")
]
```

```
print("\nDISCOURSE RELATIONS")
```

```
for source, target, relation in relations:
    print(source, "->", target, ":", relation)
```

```
print("\nDISCOURSE STRUCTURE")
print("Server crashed")
print("  |")
print("  | Cause-Effect")
print("  v")
print("Users could not access application")
print("  |")
print("  | Problem-Solution")
print("  v")
print("Technical team restarted server")
print("  |")
print("  | Sequence")
print("  v")
print("System became available")
```

The image shows a Python script in a text editor and its execution output in the IDLE Shell. The script processes a list of sentences into discourse units and relations, then prints a structured representation of the discourse.

4. Algorithm for Dialogue Act Classification

Design an algorithm to recognize **Dialogue Acts** in a conversation.

Apply your algorithm to:

User: "Hello, I need help with my assignment."

Agent: "Sure, what problem are you facing?"

User: "I do not understand machine learning."

Agent: "I can explain the basic concepts to you."

Classify each utterance into one of the following:

- Greeting
- Request
- Question
- Inform
- Offer
- Confirmation

Perform the following steps:

1. Preprocess each utterance.
2. Extract relevant linguistic features.
3. Identify the communicative intention.
4. Assign a dialogue act.
5. Generate the dialogue-act sequence.

Finally, explain how dialogue-act recognition helps a conversational agent select an appropriate next response.

Coding:

```
conversation = [
    ("User", "Hello, I need help with my assignment."),
    ("Agent", "Sure, what problem are you facing?"),
    ("User", "I do not understand machine learning."),
    ("Agent", "I can explain the basic concepts to you.")
]

def classify_utterance(text):
    text_lower = text.lower()

    if text_lower.startswith(("hello", "hi", "hey")):
        return "Greeting"

    if "?" in text:
        return "Question"

    if any(word in text_lower for word in ["need help", "help me", "please"]):
        return "Request"

    if any(word in text_lower for word in ["can explain", "can help", "i can"]):
        return "Offer"

    if text_lower.startswith(("yes", "sure", "okay", "correct")):
        return "Confirmation"

    return "Inform"

print("DIALOGUE ACT CLASSIFICATION")

5. Algorithm for Dialogue State Tracking

Design an algorithm for a **Conversational Agent** that maintains dialogue state while collecting information from a user.

Apply your algorithm to:

User: "I want to book a flight."

Agent: "Where would you like to travel?"

User: "I want to go to Delhi."

Agent: "From which city?"

User: "From Chennai."

Your algorithm should maintain the following slots:

Departure City

Destination City

Travel Date

Number of Passengers

Perform the following steps:

1. Initialize the dialogue state.
2. Identify information provided in each utterance.
3. Update the corresponding slot.
4. Identify missing information.
5. Generate the next appropriate question.

Finally, explain how dialogue state tracking improves coherence in a multi-turn conversation.

Coding:

```
dialogue = [  
    ("User", "I want to book a flight."),  
    ("Agent", "Where would you like to travel?"),  
    ("User", "I want to go to Delhi."),  
  
    ("Agent", "From which city?"),  
    ("User", "From Chennai.")  
]
```

```
state = {  
    "Departure City": None,  
    "Destination City": None,  
    "Travel Date": None,  
    "Number of Passengers": None  
}
```

```
def update_state(text):  
    text_lower = text.lower()
